

# Power WMS

Your extended arm  
in the warehouse

Power WMS is an integrated system for handheld devices with a physical barcode scanner and running Android. The system provides users with a personalised user experience for data management and the functions of the ERP systems Microsoft Dynamics 365 Business Central and Navision.

-  Manual terminal
-  Stock tracking – SSCC
-  Managed tasks
-  Easily customisable

# How will the solution help you?

## Extension of standard functionality

The Power WMS extension is an upgrade and enhances the standard warehouse management module in Dynamics 365 Business Central. It is a modular solution so you can easily customise and extend it to meet your needs.

## Live data entering

An Android app is installed on handheld terminals in the warehouse and allows warehouse workers to enter data into the system without a PC. The app guides the user step by step and simplifies the entire process. Due to the possibility of configuring different profiles in the handheld terminals, the warehouse worker only sees the data and functions that are relevant to them.

## Acceleration of warehouse processes

The solution makes work easier and faster, giving warehouse workers even more options. The warehouse worker can reconcile and post receipts based on a Power WMS document, physically counted and verified item quantities, batches and serial numbers.

## Workflow optimisation

Fast stock counting with a handheld terminal enables easy and fast movements between racks and all other warehouse functions. The system enables optimal warehouse organisation. It can advise you on storage and supports managed picking. You can also dispatch finished packages by scanning the transport labels.

## Stock tracking by logistical unit – SSCC

The possibility of inventory tracking by logistical unit (SSCC – serial shipment container code) according to the GS1 standard has been introduced. With the installation of special printers, you can print transport labels and logistical units on different materials.

+ Compatibility with Business Central

+ Communication via WEB services

+ Call and reply log

+ Modular and customisable design
